Project title

Functionalized polysaccharides for applications in biomedicine and biotechnology

Acronym

BIOPOLIZAH

Project description

General objectives -The general objective of the BIO POLIZAH project is to develop original and highly efficient strategies to allow functionalization (at preparative scale) of long chain, polydisperse mixtures of polysaccharides with functional groups such as aromatic amines, oligopeptides and chromophores, followed by detailed analysis of the coupling products using the most advanced glycoscreening and sequencing methods based on high performance mass spectrometry (MS), microfluidics technology and robotics for sample infusion into MS.

Expected results

The expected results of the project are to develop, show the feasibility, bring a proof a principle and finally standardize:

- novel methods for coupling with a variety of functional groups of complex mixtures of long chain polysaccharides

- novel glycoscreening and sequencing methods by most advanced microfluidics-MS techniques
- bioinformatics platforms to allow automatic data interpretation and characterization of the coupling products, monitoring of the functionalization and acquisition of new knowledge in the field of glycan synthesis.

Duration and budget

Duration: 23/07/2012-01/07/2016

Budget: 2.000.000,00

Scientific Authority

UEFISCDI

Coordinator

Universitatea de Medicina si Farmacie “Victor Babes” Timisoara

Partners
